

Tomato Frog

Dyscophus guineti

CARE SHEET

www.thetdi.com

Average Size 3 - 5 inches long

Average Life Span 6 - 8 years

Diet Tomato Frogs are carnivores. They can be fed crickets, mealworms, waxworms, and small roaches. An adult frog can occasionally eat small rodents such as pinky mice.

Feeding Tomato Frogs should be fed 2-3 times a week. Dust food with calcium powder every feeding, & a multivitamin once a week.

Housing Tomato Frogs can be cannibalistic when housed together as both babies and adults. However, if the frog are of similar size with multiple hiding spots available, they tend to house well together. House together at your own risk.

Size - Tomato Frogs can be kept in a 10 gallon tank as babies. An adult will require a tank measuring 30" Long x 12" Deep x 12" High, also known as a 20 Long tank.

Substrate - Due to humidity requirements an absorbent substrate is desired. Peat moss, coconut fiber, or Jungle Mix available at The Tye-Dyed Iguana are suitable.

Habitat - Tomato Frogs are found throughout the forests of Madagascar.

Temperature - Tomato Frogs need an ambient temperature of 78° to 80° F.

Watering - As long as the terrarium is set up semi-aquatic the water portion will suffice for water as long as it is kept clean. Otherwise a large water bowl with clean water should be provided. Always use de-chlorinated water.

Lighting - Lighting is not required for Tomato Frogs . For live planted terrariums or aesthetics light may be used. Low strength UVB can be used to promote plant growth and act as an anti-microbial. There is no current proof that this animal requires UVB light, although some keepers prefer to provide UVB.

Plant and Fish bulbs are not UVB bulbs.
