Rosy Boa
Lichanura trivirgata

Care Sheet

Average Size
2 - 4 feet long

Average Lifespan
15 - 20 years

Diet
Rosy Boas are strict carnivores. They can eat either frozen or live prey items. Babies will start with new born pinky mice. An adult will eat adult mice to weaned rats. When feeding frozen prey, be sure the prey is thawed thoroughly. When feeding live prey, be sure to monitor the feeding to prevent the prey from attacking the snake.

Feeding
Feed babies 1 - 2 times a week. At 2 - 3 months of age you can reduce to once weekly. Adults can eat weekly, although some keepers feed every other week. The prey size should equal the largest part of the snake’s body in girth.

Housing
Habitat - Rosy Boas come from the Southwestern United States into Northern Mexico. In the wild they are found primarily underground. Keep the cage warm and dry and provide plenty of places for hiding. Rosy Boas may be kept alone or in groups. If housed together snakes should be of similar size to avoid injury. Breeders generally keep Rosy Boas in separate enclosures until breeding time. At that point, the breeder will house the snakes together.

Size - An adult must have a minimum cage size of 30” Long x 12” Deep x 12” High, although many keepers prefer a larger cage. Babies can start in 10-gallon tanks.

Substrate - Shredded aspen is a perfect substrate. Rosy Boas love to burrow. Shredded aspen provides a fluffy substrate easy for burrowing and cleaning. A sand / coconut fiber mix can also be used. Provide 3-6 inches of substrate.

Temperature - Rosy Boas require a basking spot of 90°- 95°F. The cool end of the tank can be as cool as 70°- 75°F. Proper temperature is extremely important with this species. If a Rosy Boa becomes to cool for an extended period, they will quickly develop respiratory infections.

Humidity - Humidity levels should be between 30% - 50%.

Watering - Provide fresh drinking water daily. Boas like to soak their body in water. Provide a bowl of water large enough so that the snake can fully submerge its body.

Lighting - Since this is a nocturnal species, it requires only one light bulb. This is the heat lamp which also emits UVA. There is no current proof that the animal requires UVB light, although some keepers prefer to provide UVB.

Plant and Fish bulbs are not UVB bulbs.
