## Tomato Frog *Dyscophus guineti*

# Care Sheet

### Average Size

3 - 5 inches long

### Average Lifespan

6 - 8 years

### Diet

Tomato Frogs are carnivores. They can be fed crickets, mealworms, waxworms, and small roaches. An adult frog can occasionally eat small rodents such as pinky mice.

### Feeding

Tomato Frogs should be fed 2-3 times a week. Dust food with calcium powder every feeding, & a multivitamin once a week.

### Housing

**Habitat** - Tomato Frogs are found throughout the forests and fields of Madagascar. Tomato Frogs of similar size can be housed together with caution.

**Size** - Tomato Frogs can be kept in a 10-gallon tank as babies. An adult will require a tank measuring 30" Long x 12" Deep x 12" High, also known as a 20 Long tank.

**Substrate** - Due to humidity requirements an absorbent substrate is desired. Peat moss, coconut fiber, reptile bark or sphagnum moss are suitable.

**Temperature** - Tomato Frogs need an ambient temperature of 70° to 80° F.

**Humidity** - Tomato Frog humidity should remain high (50-75%) due to their native tropical climates. This can be maintained using a fogger, hand mister, or misting system.

**Watering** - A large water bowl with clean water should be provided. Always use de-chlorinated or bottled spring water.

**Lighting** - Lighting is not required for Tomato Frogs. For live planted terrariums or aesthetics light may be used. Low strength UVB can be used to promote plant growth and act as an anti-microbial. There is no current proof that this animal requires UVB light, although some keepers prefer to provide UVB.

**Plant and Fish bulbs are not UVB bulbs.**
